indicated that the ARH-77 (ATCC CRL-1621) cell line, which is derived from the plasma cell of a leukammia patient, expressed a specific gene at an elevated level. Sequencing confirmed it to be a novel human gene showing homology to the mouse Desert hedgehog gene. DNA encoding C-terminal sequences (see V62398) was obtained by further PCR amplifications (see V62407-08). The invention provides Desert hedgehog polynucleotides and protein, a monoclonal antibody (MAD) that recognises the protein, a process for producing the protein, and a method for detecting the protein using the MAD. The hedgehog protein, DNA and MAD can be used to elucidate hereditary morphological abnormalities in humans to establish their treatments and diagnoses.

CC This nucleotide sequence comprises a coding region for the mouse CC Desert hedgehog protein Dhh (see Y05511). The invention relates to CC a method for modulating the formation and/or maintenance of muscle CC tissue by ecotopically contacting muscle cells, especially muscle CC stem/progenitor cells, in vitro or in vivo, with a hedgehog CC therapeutic (i.e. hedgehog polypeptides and gene therapy CC constructs) or ptc therapeutic (i.e. a small organic molecule that CC mimics the effect of hedgehog proteins on patched signalling, or CC constructs or potentiates patched signalling) in an amount effective to alter the growth state of the treated cells. Also claimed is a CC method for treatment or prevention of disorders of, or surgical or CC cosmetic repair of, such muscle tissues; by administering a hedgehog polypeptide or ptc therapeutic. The disorder may be CC muscle atrophy, cachexia, or muscular myopathy (all claimed). The composition of polypeptide or ptc therapeutic can inhibit growth of medgehog polypeptide or ptc therapeutic can inhibit growth of compoblastic carowth of muscle tissue such as in myoblastic sarcoma (also claimed). The hedgehog therapeutic preferably comprises at CC (also claimed). The hedgehog therapeutic preferably comprises at CC (also claimed). The hedgehog therapeutic preferably comprises at CC (constitute extracellular portion of a hedgehog protein (see CC 905510-91) encoded by a vertebrate hedgehog gene (see X25098-107), CC especially a human hedgehog gene.

Claim 5; Page 135-37; 210pp; English.

Claim 5; Page 135-37; 210pp; English.

The sequence encodes a mouse desert hedgehog protein, homologous to a Drosophila hedgehog protein (R77337), and has been isolated by construction of a mouse genome DNA library, in phage laws stringency screening of a mouse genome DNA library, in phage clambda. The sequence contains 3 homologous regions, encoding a clambda. The sequence contains 3 homologous regions, encoding a clambda. The sequence contains 3 homologous regions, encoding a clambda. The sequence contains a homologous regions, encoding a clambda. The sequence contains a splicing has compared to polymerase chain reaction amplification of first strand cDNA generated from adult testicle RNA. Probes and primers derived from hedgehog sequences may be used as diagnostic agents.

Control of the gene may also be used in gene therapy. Antibodies generated from the encoded protein may be used as therapeutic or research reagents.

Proditions - is used for the treatment and prevention of e.g. conditions - is used for the treatment and prevention of e.g. corebral infarction, stroke and transient ischaemic attacks bisclosure; Page 65-66; 104pp; English.

Proditions - page 65-66; 104pp; English.

CA method has been developed for limiting the damage to neuronal cells by ischaemic or epoxic conditions by administering a ptc (patched) therapeutic agent to reduce cerebral infarct volume (CIV). Damage to construct which recombines with the genomic hedgehog gene to provide a heterologous transcription regulator linked to the coding region of this construct which recombines with the genomic hedgehog gene to provide a heterologous transcription regulator linked to the coding region of this corebral tissues against ischaemic injury; to treat cerebral infarct or ischaemia, stroke (thrombolic or embolic) and transient ischaemic attacks. It may also be used as a prophylactic in many other cases of conjury to the brain or spinal cord, oedema caused by trauma, haemorrhage and encephalomyelitis, or in conjunction with (coronary bypass) surgery. Treatment (which may be prophylactic) is used where ischaemic/epoxic conditions may cause cerebral hypoxia, or progressive loss of neurons due to oxygen depletion, including in patients with hypotension. The treatment reduces CIV by at least 25, particularly at least 70,%. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

         antibody

Example 1-2; Page 27-28; 39pp; English.

This cDNA sequence codes for the N-terminal region (see W79597) of a precursor form (see W79595) of novel human Desert hedgehog protein (see also W79593). Human Desert hedgehog protein DNA (HuDHH) was originally identified in human following ARH-77 (ATCC CRL-1621) cell line following ART-PCR amplification screenings. Further PCR (see V62405-06) yielded cDNA encoding the N-terminal region. DNA molecules (see V62393-95) encoding mature and precursor forms (see W79593-95) of human Desert hedgehog are claimed, as are a monoclonal
                                                                                                                                                                                                      28-OCT-1998.

The hedgehog protein, DNA and MAb can be used to elucidate hereditary morphological abnormalities in humans to establish their treatments and diagnoses.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Example 1-3; Page 28-29; 39pp; English.

This cDNA sequence codes for the C-terminal region (see W79598) of a precursor form (see W79594) of novel human Desert hedgehog protein (see also W79593). Human Desert hedgehog protein DNA (HuDHH) was criginally identified in human following RH-77 (ATCC CRL-1621) cell line following RT-PCR amplification screenings. Further PCR (see V62407-08) yielded cDNA encoding the C-terminal region. DNA molecules (see V62393-95) encoding mature and precursor forms (see W79593-95) of human Desert hedgehog are claimed, as are a monoclonal antibody (MAb) that recognises the protein, a process for producing the protein, and a method for detecting the protein using the MAb. The hedgehog protein, DNA and MAb can be used to elucidate treatments and diagnoses.

CDNA clone pHuDHH/#20 codes for a precursor (see W79596) of novel thuman Desert hedgehog protein (see also W79593). Human Desert hedgehog protein see also W79593). Human Desert hedgehog protein DNA (HuDHH) was originally identified following extensive screenings of human cell lines by PCR using primers (see V62402-03) based on the mouse Desert hedgehog gene. These screenings indicated that the ARH-77 (ATCC CRL-1621) cell line, which is derived from the plasma cell of a leukaemia patient, expressed a specific gene at an elevated level. Sequencing confirmed it to be a novel human gene showing homology to the mouse Desert hedgehog gene. Nucleotide sequences (see W62393-95) encoding mature and precursor forms (see W79593-95) of human Desert hedgehog are claimed, as are a monoclonal antibody (MAb) that method for detecting the protein using the MAB. The hedgehog protein, DNA and MAB can be used to eludate hereditary

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    be a novel human gene showing homology to the mouse Desert hedgehog gene. Nucleotide sequences (see V62394 95) encoding precursor forms (see W79594-95) of human Desert hedgehog are also claimed, as are a monoclonal antibody (MAb) that recognises the protein, as process for producing the protein, and a method for detecting the protein using the MAb. The hedgehog protein, DNA and MAb can be used to elucidate hereditary morphological abnormalities in humans to establish their treatments and diagnoses.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This cDNA sequence codes for novel human Desert hedgehog protein mature polypeptide (see W79593). Human Desert hedgehog protein DNA (HADHH) was originally identified following extensive screenings of human cell lines by PCR using primers (see V62402-03) based on the mouse Desert hedgehog gene. These screenings indicated that the ARH-77 (ATCC CRL-1621) cell line, which is derived from the plasma cell of a leukaemia patient, expressed a specific gene at an elevated level. Sequencing confirmed it to be a novel human gene ehvated level.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   antibody Claim 8; Page 20-21; 39pp; English.

PT Method for limiting damage to neurons caused by ischaemic or epoxic PT conditions - is used for the treatment and prevention of e.g. cerebral infarction, stroke and transient ischaemic attacks

PT cerebral infarction, stroke and transient ischaemic attacks

PS Disclosure; Page 74.76; 104pp; English.

CC A method has been developed for limiting the damage to neuronal cells by CC ischaemic or epoxic conditions by administering a ptc (patched) concurronal cells can also be limited by administering a gene activation construct which recombines with the genomic hedgehog gene to provide a construct which recombines with the genomic hedgehog gene to provide a construct which recombines with the genomic hedgehog gene to provide a construct which recombines with the genomic hedgehog gene to provide a construct which recombines with the genomic hedgehog gene to provide a crebral tissues against ischaemic injury; to treat cerebral infarct or ischaemia, stroke (thrombolic or embolic) and transient ischaemic or ischaemic crebral infarct or ischaemia, stroke (thrombolic or embolic) and transient ischaemic can attacks. It may also be used as a prophylactic in many other cases of conditions may cause cerebral hypoxia, or progressive loss of neurons due to oxygen depletion, including in patients with hypotension. The treatment reduces CIV by at least 25, particularly at least 70.8. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   PT increasing the survival of neuronal, dopaminergic and GABA-nergic recils - by using a ptc therapeutic such as a protein kinase rinhibitor, or an agent derived from hedgehog polypeptides, useful in the treatment of Parkinson's disease ps Disclosure; Page 95-97; 138pp; English.

CC This nucleotide sequence comprises a coding region for the human CC Inhi Indian hedgehog protein (see W97763). The invention is based on the finding that hedgehog proteins are useful as protective agents CC in the finding that hedgehog proteins are useful as protective agents CC in the general loss of dopaminergic and/or GABA-nergic neurons, CC or the general loss of dopaminergic and/or GABA-nergic neurons, CC Exemplary disorders include parkinson's disease, Huntington's CC include parkinson's disease, Huntington's CC include parkinson's disease, Huntington's CC include parkinson's clarosis and cerebral ischaemia. The invention relates to hedgehog therapeutics (i.e. agents which mimic the regulatory sequences) and ptc hedgehog polypeptides and trans-activation cc constructs for altering hedgehog yolypeptides and trans-activation occurring hedgehog proteins on patched signaling) that are effective in both human and animal subjects. A bloactive proferried. The products can also be used for the maintenance of clifferantiated neurons in cultures, and to enhance the implantation of preferried. The products can also be used for the maintenance of constructs and animal and animal. They can also be used to prevent or treat neurodegenerative conditions arising from the use of certain drugs, and in the prevention and/or treatment of hypoxia, e.g. as a neuroprotective agent.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Problem of the regulate muscle growth problem of the human comprises a coding region for the human color indian hedgehog protein in his (see y05516). The invention relates to constant the color protein for maintenance of muscle color in the following muscle cells, especially muscle constructs or put the properties and gene therapy constructs or protein for the small organic molecule that constructs or protein for polypeptides and gene therapy constructs the effect of hedgehog proteins on patched signalling, or constructs or potentiates patched signalling in an amount effective to alter the growth state of the treated cells. Also claimed is a method for treatment or prevention of disorders of, or surgical or commetic repair of, such muscle tissues, by administering a hedgehog polypeptide or ptc therapeutic. The disorder may be nedgehog polypeptide or ptc therapeutic atrophy or cardiac mysolastic growth of muscle tissue to provide treatment of hyperblastic or neoplastic growth of muscle tissue such as in mysolastic sarcoma (also claimed). The hedgehog therapeutic preferably comprises at constant a bioactive extracellular portion of a hedgehog protein (see cost). Sequence 1622 Bp; 277 A; 549 C; 510 G; 286 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

RESULT 2
A49425
Sonic hedgehog protein precursor - mouse
C;Species: Mus musculus (house mouse)
C;Accession: A49425
R;Echelard, Y; Epstein, D.J.; St-Jacques, B.; Shen, L.; Mohler, J.; McMahon, J.A.;
Cell 75, 1417-1430, 1993
A;Title: Sonic hedgehog, a member of a family of putative signaling molecules, is i:
A;Reference number: A49425; MUID:94094334
A;Accession: A49425
A;Status: preliminary; nucleic acid sequence not shown
A;Mclecule type: mRNA
A;Residues: 1-437 <ECH>
A;Cross references: GB:X76290
A;Note: authors translation is shown for the codon TCC at position 436
C;Genetics:
A;Gene: Shh
C;Superfamily: sonic hedgehog protein
RESULT 3
B53193
hedgehog homolog vhh-1 - rat
C;Species: Rattus norvegicus (Norway rat)
C;Apecies: Normania (Norway rat)
C;Apecies: Rattus norvegicus (Norway rat)
R;Reelink, H.; Augsburger, A.; Heemskerk, J.; Korzh, V.; Norlin, S.; Ruiz i Altaba, A.;
Cell 76, 761-775, 1994
A;Title: Floor plate and motor neuron induction by vhh-1, a vertebrate homolog of hedgeh
A;Title: Floor plate and motor neuron induction by vhh-1, a vertebrate homolog of hedgeh
A;Reference number: A53193; MUID:94170375
A;Rocession: B53193
A;Status: preliminary
A;Molecule type: mRNA
A;Residues: 1-437 - ROE>
A;Cross-references: GB:L27340; NID:g452122; PIDN:AAA20999.1; PID:g452123

hedgehog homolog vhh-1 - zebra fish
C;Species: Brachydanio rerio (zebra fish)
C;Species: Brachydanio rerio (zebra fish)
C;Date: 06-Jan-1995 #sequence_revision 06-Jan-1995 #text_change 10-Dec-1999
C;Accession: A53193
R;Rocelink, H.; Augsburger, A.; Heemskerk, J.; Korzh, V.; Norlin, S.; Ruiz i Altaba, A.;
Cell 76, 761-775, 1994
A;Title: Floor plate and motor neuron induction by vhh-1, a vertebrate homolog of hedgeh
A;Reference number: A53193; MUID:94170375
A;Accession: A53193
A;Status: preliminary
A;Molecule type: mRNA
A;Residues: 1-418 <ROE>
A;Cross-references: GB:L27585; NID:9452159; PID:g452160
C;Superfamily: sonic hedgehog protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               망

                                                                                                                                                 ۲
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           PIM: THE C-TERMINAL DOMAIN DISPLAYS AN AUTOPROTEOLYSIS ACTIVITY AND A CHOLESTEROL TRANSFERASE ACTIVITY. BOTH ACTIVITIES RESULT IN THE CLEAVAGE OF THE FULL-LENGTH PROTEIN AND COVALENT ATRACHMENT OF A CHOLESTEROL MOIETY TO THE C-TERMINAL OF THE NEWLY GENERATED N-TERMINAL FRACMENT (N-PRODUCT). THIS COVALENT MODIFICATION APPEARS TO PLAY AN ESSENTIAL ROLE IN RESTRICTING THE SPATIAL DISTRIBUTION OF THE PROTEIN ACTIVITY TO THE CELL SURFACE. THE N-PRODUCT IS THE ACTIVE SPECIES IN BOTH LOCAL AND LONG-RANGE SIGNALING, WHEREAS THE C-PRODUCT HAS NO SIGNALING ACTIVITY (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DEVELOPMENT.
SUBCELLULAR LOCATION: THE C-TERMINAL PEPTIDE DIFFUSES FROM THE
CELL, WHILE THE N-TERMINAL PEPTIDE REMAINS ASSOCIATED WITH THE
CELL SURFACE. IS ALSO SECRETED IN EITHER CLEAVED OR UNCLEAVED
TO MEDIATE SIGNALING TO OTHER CELLS (BY SIMILARITY).
TISSUE SPECIFICITY: EXPRESSED IN ADULT TESTES. NOT EXPRESSED I
LIMB BUDS.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                181
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 181
                                                                                                                                                                                                    NEURULA EXPRESSION BECOMES RESTRICTED TO ANTERIOR STRUCTURES, ENCOMPASSING BOTH NEURAL PLATE AND ENDODERMAL CELLS.

PYM: THE C-TERMINAL DOMAIN DISPLAYS AN AUTOPROTEOLYSIS ACTIVITY AND A CHOLESTEROL TRANSFERASE ACTIVITY. BOTH ACTIVITIES RESULT IN THE CLEAVAGE OF THE FULL-LENGTH PROTEIN AND COVALENT ATTACHMENT OF A CHOLESTEROL MOIETY TO THE C-TERMINAL OF THE NEWLY GENERATED N-TERMINAL FRAGMENT (N-PRODUCT). THIS COVALENT MODLFICATION APPEARS TO PLAY AN ESSENTIAL ROLE IN RESTRICTING THE SPATIAL DISTRIBUTION OF THE PROTEIN ACTIVITY TO THE CELL SURFACE. THE N-PRODUCT IS THE ACTIVE SPECIES IN BOTH LOCAL AND LONG-RANGE SIGNALING, WHEREAS THE C-PRODUCT HAS NO SIGNALING ACTIVITY (BY SIMILARITY).

SIMILARITY: BELONGS TO THE HEDGEHOG FAMILY.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                            7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     PIM: THE C-TERMINAL DOMAIN DISPLAYS AN AUTOPROTEOLYSIS ACTIVITY AND A CHOLESTEROL TRANSFERASE ACTIVITY. BOTH ACTIVITES RESULT IN THE CLEAVAGE OF THE FULL-LENGTH PROTEIN AND COVALENT ATTACHMENT OF A CHOLESTEROL MOLETY TO THE C-TERMINAL OF THE NEMLY GENERATED N-TERMINAL FRAGMENT (N-PRODUCT). THIS COVALENT MODIFICATION APPEARS TO PLAY AN ESSENTIAL ROLE IN RESTRICTING THE SPATIAL DISTRIBUTION OF THE PROTEIN ACTIVITY TO THE CELL SURFACE. THE N-PRODUCT IS THE ACTIVE SPECIES IN BOTH LOCAL AND LONG-RANGE SIGNALING, WHEREAS THE C-PRODUCT HAS NO SIGNALING ACTIVITY (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    FUNCTION: SIGNAL INVOLVED IN THE EARLY INDUCTION AND PATTERNING OF ANTERODORSAL ECTODERM, NERVOUS SYSTEM AND SOMITES. INDUCES ECTOPIC CEMENT GLAND FORMATION IN EMBRYOS.

SUBCELLULAR LOCATION: THE C-TERMINAL PEPTIDE DIFFUSES FROM THE CELL, WHILE THE N-TERMINAL PEPTIDE REMAINS ASSOCIATED WITH THE CELL SURFACE. HEDGEHOG PROTEIN IS ALSO SECRETED IN EITHER CLEAVED OR UNCLEAVED FORM TO MEDIATE SIGNALING TO OTHER CELLS (BY
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SIMILARITY)

1. TISSUE SPECIFICITY: EXPRESSED IN A NUMBER OF EMBRYONIC TISSUES INCLUDING THE NOTOCHORD, VENTRAL NEURAL TUBE, FLOOR PLATE, LUNG BUD, ZONE OF POLARIZING ACTIVITY AND POSTERIOR DISTAL MESENCHYME OF LIMBS. IN THE ADULT, EXPRESSED IN LUNG AND NEURAL RETINA.

1. DEVELOPMENTAL STAGE: FIRST DETECTABLE DURING GASTRULATION.

1. INDUCTION: BY RETINOLD ACID.

1. PIM: THE C-TERMINAL DOMAIN DISPLAYS AN AUTOPROTEOLYSIS ACTIVITY AND A CHOLESTEROL TRANSFERASE ACTIVITY. BOTH ACTIVITIES RESULT IN THE CLEAVAGE OF THE FULL-LENGTH PROTEIN AND COVALENT ATTACHMENT OF A CHOLESTEROL MOIETY TO THE C-TERMINAL OF THE NEMLY GENERATED N-TERMINAL FRAGMENT (N-PRODUCT). THIS COVALENT MODIFICATION APPEARS TO PLAY AN ESSENTIAL ROLE IN RESTRICTING THE SPATIAL DISTRIBUTION OF THE PROTEIN ACTIVITY TO THE CELL SURFACE. THE N-PRODUCT IS THE ACTIVE SPECIES IN BOTH LOCAL AND LONG-RANGE SIGNALING, WHEREAS THE CAPRODUCT HAS NO SIGNALING ACTIVITY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This SWISS-PROT entry is copyright.                                                                                                                                                         TISSUE SPECIFICITY: EXPRESSED IN THE NODE, NOTOCHORD, FLOOR PLATE, AND POSSTERIOR LIMB BUD MESENCHYME.

PM: THE C.TERMINAL DOMAIN DISPLAYS AN AUTOPROTEOLYSIS ACTIVITY AND A CHOLESTEROL TRANSFERASE ACTIVITY. BOTH ACTIVITIES RESULT IN THE CLEAVAGE OF THE FULL-LENGTH PROTEIN AND COVALENT ATTACHMENT OF A CHOLESTEROL MOIETY TO THE C-TERMINAL OF THE NEWLY GENERATED N-TERMINAL FRAGMENT (N-PRODUCT). THIS COVALENT MODIFICATION APPEARS TO PLAY AN ESSENTIAL ROLE IN RESTRICTING THE SPATIAL DISTRIBUTION OF THE PROTEIN ACTIVITY TO THE CELL SURFACE. THE N-PRODUCT IS THE ACTIVE SPECIES IN BOTH LOCAL AND LONG-RANGE SIGNALING, WHEREAS THE C-PRODUCT HAS NO SIGNALING ACTIVITY (BY SIMILARITY).

SIMILARITY: BELONGS TO THE HEDGEHOG FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ASSOCIATION WITH SMOOTHENED (SMO), TO ACTIVATE THE TRANSCRIPTION OF TARGET GENES. IN THE ABSENCE OF SHH, PTC REPRESSES THE CONSTITUTIVE SIGNALING ACTIVITY OF SMO. ALSO REGULATES ANOTHER CARGET, THE GLI ONCOGENE. INTERCELLULAR SIGNAL ESSENTIAL FOR A VARIETY OF PATTERNING EVENTS DURING DEVELOPMENT: SIGNAL PRODUCED BY THE NOTOCHORD THAT INDUCES VENTRAL CELL FATE IN THE NEURAL TUBE AND SOMITES, AND THE POLGAZION FOR PATTERNING OF THE ANTERIOR POSTERIOR AXIS OF THE DEVELOPING LIMB BUD. DISPLAYS BOTH FLOOR PLATE-AND MOTOR NEURON-INDUCING ACTIVITY. THE THRESHOLD CONCENTRATION OF N-PRODUCT REQUIRED FOR MOTOR NEURON INDUCTION IS
                                                                                                                                                                                                                                                                                                                                                                                                      SUBCELLULAR LOCATION: THE C-TERMINAL PEPTIDE DIFFUSES FROM THE CELL, WHILE THE N-TERMINAL PEPTIDE REMAINS ASSOCIATED WITH THE CELL SURFACE. IS ALSO SECRETED IN EITHER CLEAVED OR UNCLEAVED. TO MEDIATE SIGNALING TO OTHER CELLS (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      FUNCTION: BINDS TO THE PATCHED (PTC) RECEPTOR, WHICH FUNCTIONS I ASSOCIATION WITH SMOOTHENED (SMO), TO ACTIVATE THE TRANSCRIPTION

TO MEDIATE SIGNALING TO OTHER CELLS (BY SIMILARITY).

IT ISSUE SPECIFICITY: EXPRESSED IN THE POSTERIOR LIMB BUD MESENCHYME, THE HENSEN'S NODE, THE NOTCHORD, AND THE FLOOR PLATE OF THE NUTLATIONS. THE HENSEN'S NODE, THE NOTCHORD, AND THE FLOOR PLATE OF THE NUTLATION OF LIMB BUD FORMATION. FROM THAT POINT ONWARDS, THE EXPRESSION PATTERN EXACTLY MATCHES THE LOCATION OF THE ZONE OF POLARIZING ACTIVITY (ZPA).

INDUCTION: BY RETINOID ACID.

INDUCTION: BY RETINOID ACID.

AND A CHOLESTEROL TRANSFERASE ACTIVITY. BOTH ACTIVITIES RESULT IN THE CLEAVAGE OF THE FULL-LENGTH PROTEIN AND COVALENT ATTACHMENT OF A CHOLESTEROL MOIETY TO THE C-TERMINAL OF THE NEWLY GENERATED N-TERMINAL FRACKENT (N-PRODUCT). THIS COVALENT MODIFICATION APPEARS OF THE PROTEIN ACTIVITY OF THE CELL SURFACE. THE N-PRODUCT IS THE ACTIVE SPECIES IN BOTH LOCAL AND LONG-RANGE SIGNALING, WHEREAS THE C-PRODUCT HAS NO SIGNALING ACTIVITY.

SIMILARITY: BELONGS TO THE HEDGEHOG FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ASSOCIATION WITH SMOOTHENED (SMO), TO ACTIVATE THE TRANSCRIPTION OF TARGET GENES. IN THE ABSENCE OF SHH, PTC REPRESSES THE CONSTITUTIVE SIGNALING ACTIVITY OF SMO. ALSO REGULATES ANOTHER CARGET, THE GLI ONCOGENE. INTERCELLULAR SIGNAL ESSENTIAL FOR A VARIETY OF PATTERNING EVENTS DURING DEVELOPMENT: SIGNAL PRODUCED BY THE NOTOCHORD THAT INDUCES VENTRAL CELL FATE IN THE NEURAL TUBE AND SONITES, AND THE POLARIZING SIGNAL FOR PATTERNING OF THE ANTERIOR-POSTERIOR AXIS OF THE DEVELOPING LIMB BUD. DISPLAYS BOTH FLOOR PLATE. AND MOTOR NEURON-INDUCTING ACTIVITY. THE THRESHOLD CONCENTRATION OF N-PRODUCT REQUIRED FOR MOTOR NEURON INDUCTION IS 5-FOLD LOWER THAN THAT REQUIRED FOR PLOOR PLATE INDUCTION IS 5-FOLD LOWER THAN THAT REQUIRED FOR PLOOR PLATE INDUCTION.

SUBCELLULAR LOCATION: THE C-TERMINAL PEPTIDE DIFFUSES FROM THE CELL, WHILE THE N-TERMINAL PEPTIDE DIFFUSES FROM THE CELL, WHILE WHITH THE N-TERMINAL PEPTIDE DIFFUSES FROM THE CELL, WHILE WHITH THE N-TERMINAL PEPTIDE DIFFUSES FROM THE CELL, WHILE WHITH THE N-TERMINAL PEPTIDE DIFFUSES FROM THE CELL, WHITH THE N-TERMINAL PEPTIDE DIFFUSES FROM THE CELL, WHITH THE N-TERMINAL PEPTIDE DIFFUSES FROM THE CELL WHITH THE N-TERMINAL PEPTIDE DIFFUSES FR
                                                                                                                      Signal
